NATIONAL EXAMS

Phys-A6: Solid State Physics

3 hours duration

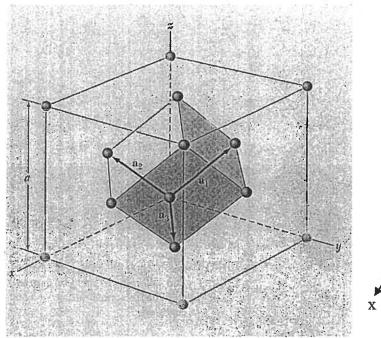

NOTES:

- 1. If doubt exits as to the interpretation of any question, the candidate must submit with the answer paper, a clear statement of any assumption made.
- 2. Candidates may use one of two calculators, the Casio or Sharp approved models.
- 3. This is a CLOSED BOOK EXAM.
 Useful constants and equations have been annexed to the exam paper.
- 4. Any FIVE (5) of the SEVEN (7) questions constitute a complete exam paper. The first five questions as they appear in the answer book will be marked.
- 5. When answering questions, candidates must clearly indicate units for all parameters used or computed.

MARKING SCHEME

Questions	Marks			
1	(a) 5	(b) 5	(c) 10	
2	(a) 6	(b) 6	(c) i. 4	(c) ii. 4
3	(a) 10	(b) 7	(c) 3	
4	(a) 9	(b) 4	(c) 7	
5	(a) 5	(b) 10	(c) 5	
6 .	(a) 8	(b) 12		
7	(a) 8	(b) 8	(c) 4	

1. A face centered cubic (fcc) lattice and its primitive cell are show in Figure P1a and a lattice plane of this crystal is shown in Figure P1b.

Z 2 1 2 1 2 1 2 1 2 X

Figure P1a

Figure P1b

- 5 pts (a) Calculate the packing fraction for this cubic lattice. [Note: $V_{sphere} = \frac{4\pi r^3}{3}$]
- ^{5 pts} (b) Find the Miller indices for the plane shown in Figure P1b.
- 10 pts (c) Find the primitive translation vectors b_1 , b_2 and b_3 for the reciprocal lattice for the fcc lattice.

May 2013

2. The interaction between two inert gas atoms takes the form of the normalized potential $U(R)/\epsilon$ shown in Figure P2.

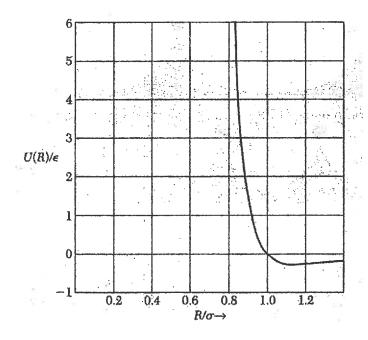

Figure P2

6 pts (a) What is the name of this potential?

6 pts (b) Briefly explain what the negative part of the curve signifies?

(c) Measurements done at very low temperature for hydrogen (H₂) gave the following parameter values

$$\epsilon = 40 \times 10^{-16} \text{ erg}$$
 $\sigma = 3 \text{ Å}$

Assuming that at this temperature the H_2 molecules are hard spheres in an fcc lattice structure:

i. Calculate the value of the interaction potential (in Joules) between H₂ molecules when they are 3.6 Å apart.

4 pts ii. Calculate the cohesive energy in kJ per mole of H₂.

3. Consider vibrations in a crystal with a monatomic basis where each atom has a mass M and a force constant C between nearest-neighbour lattice planes. Plane displacements are illustrated in Figure P3.

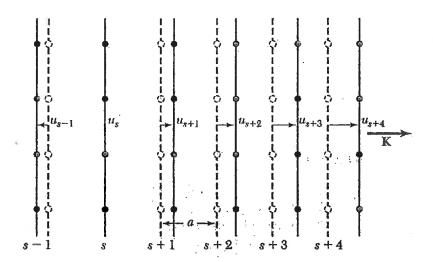

Figure P3

Assuming displacements of the form $u_s = u \exp(isKa)$ all having the time dependence $\exp(-i\omega t)$ and considering only nearest planes,

10 pts (a) Show that the dispersion relation $\omega(K)$ is given by $\omega = \sqrt{\left(\frac{4C}{M}\right)} \left| \sin\left(\frac{Ka}{2}\right) \right|$

⁷pts (b) Plot the dispersion relation for the *first Brillouin zone*.

^{3 pts} (c) What sort of waves are present at the the first Brillouin zone boundaries?

May 2013

4. Particles which behavior follows the Fermi-Dirac distribution are called *fermions*. The 3-dimensional Fermi surface of fermions is shown in Figure P4. Just like free electrons, the helium-3 (He³) atoms behave like fermions. He³ is composed of 3 atomic mass units: 2 protons and 1 neutron. The density of He³ near absolute zero temperature is 0.081 g/cm³.

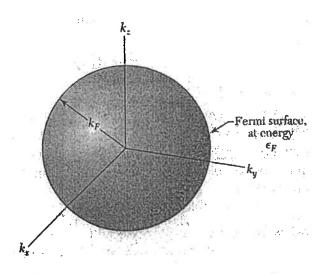

Figure P4

- ^{9 pts} (a) Show that He³ atoms have a Fermi energy \in_F of about 7 x 10⁻¹⁶ erg.
- 4 pts (b) What is the Fermi temperature T_F that corresponds to this Fermi energy?
- 7 pts (c) Assuming that the *chemical potential* is approximately equal to \in_F , what is the probability that an atom of He³ would occupy an energy level of $\in =20\in_F$ at T=45 °K?

		y of various allowed energy s filled with electrons.	bands for five case	s is shown in Fig	ure P5. The gre

Si	Au	0.001	1.13
Ge	Ge	10.0	3.1

- 8 pts (a) Briefly explain how the presence of impurities such as arsenic (As) in pure silicon (Si) can actually be useful in solid state devices.
- (b) Sodium (Na) has a density of 0.971 g/cm³ and its atomic weight is 23 amu. If the energy to take an atom of Na from its normal lattice site to a lattice site at the surface of the crystal is 1.05 eV, calculate the concentration of defect vacancies present at a temperature of 300 °K.
- 4 pts (c) Determine at what rate aluminum (Al) atoms would diffuse into a lattice of pure silicon (Si) at a temperature of 1200 °K.

USEFUL EQUATIONS AND CONSTANTS

(1)
$$sin^2\theta = \frac{1}{2}(1 - \cos 2\theta)$$
 $cos\theta = \frac{1}{2}[\exp(i\theta) + \exp(-i\theta)]$

(2)
$$T = u_1 a_1 + u_2 a_2 + u_3 a_3$$

(3)
$$G = v_1b_1 + v_2b_2 + v_3b_3$$

(4)
$$p = r \times t = \begin{pmatrix} p_1 \\ p_2 \\ p_3 \end{pmatrix} (x \ y \ z) = \begin{pmatrix} r_2 t_3 - r_3 t_2 \\ r_3 t_1 - r_1 t_3 \\ r_1 t_2 - r_2 t_1 \end{pmatrix} (x \ y \ z)$$
 where $r = r_1 x + r_2 y + r_3 z$ $t = t_1 x + t_2 y + t_3 z$

$$(5) \quad V_{min} = |a_1 \cdot a_2 \times a_3|$$

(6)
$$b_1 = 2\pi \frac{a_2 \times a_3}{a_1 \cdot a_2 \times a_3}$$
 $b_2 = 2\pi \frac{a_3 \times a_1}{a_1 \cdot a_2 \times a_3}$ $b_3 = 2\pi \frac{a_1 \times a_2}{a_1 \cdot a_2 \times a_3}$

(7)
$$2d \sin \theta = n\lambda$$
 $\Delta k = G$ $2k \cdot G = G^2$

(8)
$$U(R) = 4\epsilon \left[\left(\frac{\sigma}{R} \right)^{12} - \left(\frac{\sigma}{R} \right)^{6} \right]$$

(9)
$$U_{tot} = -(2.15)(4N\varepsilon)$$

(10)
$$F_s = C(u_{s+1} - u_s) - C(u_{s-1} - u_s)$$

(11)
$$M \frac{d^2 u_s}{dt^2} = C(u_{s+1} - u_s) - C(u_{s-1} - u_s)$$

$$(12) \quad f(\in) = \frac{1}{\exp\left[\frac{\epsilon - \mu}{k_B T}\right] + 1}$$

$$(13) \quad \epsilon_F = \frac{\hbar}{2m} \left(\frac{3\pi^2 N}{V} \right)^{2/3}$$

(14)
$$np = 4 \left(\frac{k_B T}{2\pi\hbar^2}\right)^3 (m_e m_h)^{3/2} \exp\left(\frac{-E_g}{k_B T}\right)$$

(15)
$$n_i = p_i = 2\left(\frac{k_B T}{2\pi\hbar^2}\right)^{3/2} (m_e m_h)^{3/4} \exp\left(\frac{-E_g}{2k_B T}\right)$$

(16)
$$\mu = \frac{E_g}{2} + \frac{3}{4} k_B T \ln (m_h/m_e)$$

(17)
$$\chi = -\frac{\mu_o N Z e^2}{6m} \langle r^2 \rangle$$

$$(18) \quad \frac{n}{N-n} = exp\left(\frac{-E_V}{k_B T}\right)$$

$$(19) \quad D = D_o exp\left(\frac{-E}{k_B T}\right)$$
